```
int main()

Sorted Array (Selection Sort)

- Simple and efficient algo
- Works by repeatedly selecting the smallest (or largest) element from the unsorted portion of the list and moving it to the sorted position of list

(3)

Bubble Sort

main()

{

int a[10], i, j, temp;

for (i=0; i<10; i++)

{

scanf ("%d", &a[i]);

}

for (i=0; i<10; i++)

{

for (j=i+1; j<=i+1; j++)

{

if (a[j] > a[i+1])

{

temp = a[j];

a[j] = a[i+1];

a[i+1] = temp;

{

}

for (i=0; i<10; i++)

{

printf ("%d", a[i]);

{

Bubble sort.

(i)	4	5	1	3	2	4	5	3	2	5	(ii)

Concept works by repeatedly swapping the adjacent elements if they are in wrong order.

Insertion Sort

(5)

- Idea is to divide the list into two parts: a sorted part and unsorted part
- Initially sorted part contains only 1st element of list. While rest of list is in unsorted part.
- The algo then iterates through each element in the unsorted part, picking one at a time and insert into its correct position in sorted part.

main ()

2 int a[10], temp, j, i;

for (i = 1; i < n; i++)

2 temp = a[i];

j = i - 1;

while (j >= 0 && a[j] > temp)

2 a[j + 1] = a[j];

①

3	5	1	4	2

$a[j] > \text{temp}$, true

so $a[j+1], a[j]$:

3 will move right
